

**SYSTEM AND METHOD FOR PROVIDING AN IMAGE FILE IN A
COMPUTER SYSTEM**

Abstract

5 A computer system comprising a memory including a host and an image
file, a processor configured to execute the host, an input / output (I/O) controller
coupled to the processor, and a management processing system coupled to the
I/O controller and including a first storage location, a first memory, and a second
10 memory is provided. The host is configured to cause the processor to store a
first portion of the image file in the first memory, the host is configured to cause
the processor to set the first storage location subsequent to storing the first
portion in the first memory, and the management processing system is
configured to store the first portion of the image file in the second memory in
15 response to detecting that the first storage location has been set.
